

How to Generate AccuKnox-Branded Docs and PPTs with Claude Code

Claude Code can take any Word doc or Google Slides deck and reformat it into AccuKnox branding, correct logo, colors, and layout, in one pass. Works for both docs and PPTs, and you can batch as many files as you want in one go.

Prerequisites

- An active Claude Code subscription. We use one shared account (website@accuknox.com, 30+ users). Claude desktop must be installed, and you work inside the Claude Code window.
- The docs or PPTs you want branded, saved locally on your PC.
- The doc-ppt-template repo cloned locally: <https://github.com/accuknox/doc-ppt-template>

Steps

1. Clone the doc-ppt-template repo and load it in Claude Code.
2. Attach the docx or PPT you want to rebrand into AccuKnox's branding.
3. Reference the template files using the @ selector. Both live at the root of the doc-ppt-template repo:
 - Word doc → WORD_TEMPLATE_ACCUKNOX.docx
 - Presentation → PPT Template.pptx
4. Set permissions to “Bypass permissions” so Claude works autonomously.
5. Use Sonnet 5 only. Do not use Opus for this task.

Example Prompt

@doc-ppt-template Brand the attached DOCX file with AccuKnox branding, do it well and ensure it looks as per the expected outcome, be strict and use the logo correctly as well.

2) Attach the docx or PPT you want to rebrand into AccuKnox's branding

3) Reference the template files:
For word doc -
WORD_TEMPLATE_ACCUKNOX.docx
For presentations - PPT
Template.pptx

Both these files are in the
folder @utils/doc-ppt-template

1) Clone Help Docs Repo & load in Claude Code

Use the @ selector to add these
files to context

4) Set to bypass permissions
so claude works autonomously.

5) Use Sonnet 5 Only! Do not use Opus for this task!!

The five steps above, shown inside Claude Code. (Screenshot predates the doc-ppt-template repo split; the @ selector and Bypass Permissions workflow are unchanged.)

Before / After

The same comparison table, before and after AccuKnox branding is applied.

BEFORE

ACCUKNOX Platform Comparison		
AccuKnox ASPM and SonarQube Cloud - Extending Code Security to Full Application, API, AI, and Cloud Risk		
SonarQube Cloud (formerly SonarCloud) is a well-established code quality and SAST platform, and many engineering teams already rely on it inside the SDLC. AccuKnox ASPM is built to extend that same rigor beyond the pull request — fusing SAST, DAST, SCA, secrets, IaC, and SBOM with API security, AI/LLM security, CNAPP, and runtime enforcement in a single, correlated risk graph. The two platforms are frequently run together: SonarQube Cloud strengthens code quality and developer feedback, while AccuKnox closes the gap from code to cloud to runtime.		
Capability	AccuKnox ASPM	SonarQube Cloud
AI-SAST	- Tiered AI-accelerated SAST: deterministic rules, fine-tuned LLM triage, and large-model review in one pipeline - Findings prioritized using reachability and runtime context, so teams focus on what's actually exploitable. AI Assisted Remediation using the context	- AI Code Assurance and Agentic Analysis identify and gate AI-generated code - AI CodeFix offers AI Assisted remediation suggestions for supported rule violations
Rule Engine & Automation	Automated ticketing, ownership routing, and noise reduction across all domains	- Sonarqube doesn't offer - Custom rule authoring for teams standardizing code-quality policy
Quality Gates	- Policy-as-code gates that can block a release based on code, container, IaC, or API risk — not code alone - Gates can factor in live exploitability, not just static severity	- Go/no-go Quality Gate at the pull-request level - Branch analysis and PR decoration with configurable pass/fail thresholds
IDE Extension	Findings and fix guidance surfaced in-editor through IDE plugin across VS Code, Cursor, IntelliJ and Windsurf	SonarQube for IDE plugin across VS Code, IntelliJ, Cursor, and Windsurf
SBOM & Dependency Graph	- xSBOM generates SBOM, CBOM, QBOM, and AI-BOM, covering software, cryptography, and AI components - Dependency graph mapped to attack paths and runtime reachability, aligned to CERT-in and RBI reporting needs	SonarQube doesn't have SBOM but offers SCA identifies vulnerable open-source dependencies within the code-scanning workflow
SCA	Integrated SCA across proprietary and open-source dependencies	SCA available as part of SonarQube Advanced Security, reviewing AI, first-party, and open-source code

AFTER

AccuKnox ASPM vs. SonarQube Cloud		
CUSTOMER COMPARISON		
SonarQube Cloud (formerly SonarCloud) is a well-established code quality and SAST platform, and many engineering teams already rely on it inside the SDLC. AccuKnox ASPM is built to extend that same rigor beyond the pull request, fusing SAST, DAST, SCA, secrets, IaC, and SBOM with API security, AI/LLM security, CNAPP, and runtime enforcement in a single, correlated risk graph. The two platforms are frequently run together: SonarQube Cloud strengthens code quality and developer feedback, while AccuKnox closes the gap from code to cloud to runtime.		
Capability	AccuKnox ASPM	SonarQube Cloud
AI-SAST	- Tiered AI-accelerated SAST: deterministic rules, fine-tuned LLM triage, and large-model review in one pipeline - Findings prioritized using reachability and runtime context, so teams focus on what's actually exploitable	- AI Code Assurance and Agentic Analysis identify and gate AI-generated code - AI CodeFix offers AI assisted remediation suggestions for supported rule violations
Rule Engine & Automation	Automated ticketing, ownership routing, and noise reduction across all domains	- No automated ticketing or routing engine - Custom rule authoring for teams standardizing code-quality policy
Quality Gates	- Policy-as-code gates that can block a release based on code, container, IaC, or API risk, not code alone - Gates can factor in live exploitability, not just static severity	- Go/no-go quality gate at the pull-request level - Branch analysis and PR decoration with configurable pass/fail thresholds
IDE Extension	Findings and fix guidance surfaced in-editor through IDE plugin across VS Code, Cursor, IntelliJ, and Windsurf	SonarQube for IDE plugin across VS Code, IntelliJ, Cursor, and Windsurf
SBOM & Dependency Graph	- xSBOM generates SBOM, CBOM, QBOM, and AI-BOM, covering software, cryptography, and AI components - Dependency graph mapped to attack paths and runtime reachability, aligned to CERT-in and RBI reporting needs	- No native SBOM generation - SCA identifies vulnerable open-source dependencies within the code-scanning workflow
SCA	Integrated SCA across proprietary and open-source dependencies	Available as part of SonarQube Advanced Security, reviewing AI, first-party, and open-source code
DAST	- Native DAST in the same pipeline - Authenticated TOTP-based scans supported - Coverage for OWASP Top 10 with Baseline and Extended Scan	Not a native capability, typically paired with a separate DAST tool
